FIN-SIM RISK SANDBOX — SYNTHETIC RISK SIMULATION ENGINE

Overview:

A privacy-safe AI simulation platform that generates synthetic financial events (UPI, EMI, loan, card transactions, fraud, credit risk) to test and validate risk models for fintechs, banks, and insurers — without using real user data.

Core Proposition:

We provide a plug-and-play sandbox where companies can stress-test fraud and credit models using high-fidelity synthetic data. No compliance hurdles, no privacy risk, no dependency on real transactions.

Problem:

Banks and fintechs can’t test AI models safely due to DPDP restrictions, RBI sandbox limitations, and real-data scarcity. Testing risk models on production data violates compliance and exposes sensitive information.

Solution:

A synthetic “digital twin” of India’s financial ecosystem powered by agent-based simulation. Millions of synthetic users interact, transact, default, invest, and generate dynamic behavior patterns that mimic real economics.

Key Features:

- Synthetic, regulation-safe financial datasets
- Fraud and risk model stress-testing sandbox
- DPDP compliance validation toolkit
- Credit, UPI, insurance, and transaction simulations
- API access for continuous model testing

Target Users:

Banks, NBFCs, fintechs, RegTech companies, insurers, and data science labs.

Revenue Model:

1. Annual enterprise license (■25L–■1Cr)
2. Simulation-as-a-service API (■10K per 10K runs)
3. DPDP compliance certification add-on
4. Custom stress-test modules (fraud, credit, insurance)

Go-to-Market:

- Phase 1: Fintech startups (fast pilots)
- Phase 2: Mid-tier banks and NBFCs
- Phase 3: RegTech partners and RBI sandbox inclusion
- Phase 4: Expansion to Southeast Asia

Competitive Edge:

1. Agent-based simulation = deeper realism
2. Zero compliance friction
3. Rapid validation of risk models
4. No dependency on third-party data

Vision:

To become India’s default synthetic risk and compliance infrastructure — the “AI insurance layer” for financial institutions.
